ABSTRACT

This is the second of a four-volume report of Project EDNEED II (Empirical Determination of Nationally Essential Educational Data). (Project EDNEED II, conducted from July 1975 to September 1976, was designed to document the extent to which data currently collected by State vocational education agencies could be used to answer prioritized vocational education informational needs for all 50 States and five U.S. territories.) This volume presents the data base that was constructed as a result of the comparison between needed and collected vocational education data from all 50 States and five of the U.S. territories. The data base consists of 209 questions and 1,065 information elements, with accompanying indexes that demonstrate for each information unit how "needed" and how "collected" it is, or the relative need and current availability of the information elements. The index of need reflects the combined ratings of Federal, State, and local user groups, with each level receiving equal importance weightings in the analyses. This volume also includes the project summary, an index to the files and questions, a foreward on the utility and organization of the data base, and a list of references. (HD)

THE CENTER

John K. Coster, Director

The Center for Occupational Education at North Carolina State University at Raleigh is a research and development center established in 1965 under the provisions of the Vocational Education Act of 1963. The Center has been established as an integral unit within the School of Education at North Carolina State University, and its major programs have been supported by contracts and grants with the National Institute of Education and the U. S. Office of Education. The Center has as its mission the provision—through research, development, and related activities—of a continuing contribution to the improvement of occupational education. The major research and development programs of the Center focus on the relationship of occupational education to its context or environment. The frame of reference for occupational education includes its relationship to regional economy, politics, and the employment or work environment. In addition the Center has a capability for flexible action within its overall mission through activities negotiated on a project-by-project basis with contracting agencies.

THE EDNEED SERIES IN VOCATIONAL EDUCATION

The EDNEED (Empirical Determination of Nationally Essential Educational Data) Series published by the Center for Occupational Education, North Carolina State University consists of a five volume final report entitled **Data Needs in Vocational Education** and a four volume final report entitled **Data Availability in Vocational Education**. The former is a product of Project EDNEED I, G. William Porter, Project Director; the latter is a product of EDNEED II, co-directed by Douglas Katz and John E. S. Lawrence. Both EDNEED projects were funded by the U. S. Office of Education, Bureau of Occupational and Adult Education, under Part C Grants.

ADDITIONAL INFORMATION

For additional information regarding the program of the Center, please write to:

Dr. John K. Coster, Director
Center for Occupational Education
North Carolina State University at Raleigh

Raleigh, North Carolina 27607

ACKNOWLEDGEMENTS

The first phase of Project EDNEED II has been entirely dependent on the time and effort expended by the states and territories in their excellent (98.2%) response to the forms survey. Grateful appreciation is extended to all staff personnel in vocational education agencies throughout the states and territories who patiently responded to the initial survey and to subsequent follow-up and verification procedures. The project also gratefully acknowledges the assistance of Mr. Harold Duis of the U. S. Office of Education, Mr. William Nightwine, formerly of Project Baseline, and the Committee on Evaluation and Information Systems (CEIS) of the Council of Chief State School Officers in supplying material used in the study.

Numerous professional vocational educators, consultants and technical MIS personnel have helped with discussion, advice and critical appraisal during the span of this project. Particular mention, however, should be made of the expertise and counsel of Dr. Donald Drewes and Dr. Joseph Nerden of Conserva, Inc. The assistance throughout the project of Mr. Jack Wilson, Project Monitor, is especially appreciated. The compilation of this Data Base involved much laborious effort in the transcription of close to 11,000 data items from over 2,000 SVEA forms. The competent programming of Mr. Carol Perkins and the cooperation of the Statistical Analysis System Institute, Inc., made the task considerably easier.

Finally, grateful acknowledgement is extended to the former Project Director, Dr. Robert Morgan, and to the entire staff of the Center for Occupational Education for their commitment to the successful completion of the project.

PROJECT SUMMARY

Project EDNEED was conceived as an important first step toward the development of a basic information system for vocational education. Project EDNEED I (July, 1974 - December, 1975) focused on the identification and prioritization of the vocational education informational needs of users at the national, state and local levels. One product of that effort was a prioritized listing of data questions concerning vocational education which reflected the informational needs at all three levels. Those prioritized questions served as a primary input to the present study.

Project EDNEED II (July, 1975 - September, 1976) was designed to document the extent to which data currently collected by state vocational education agencies could be used to answer the prioritized Project EDNEED I questions. Two approaches were used to achieve this goal. The first phase focused on the gathering and cataloguing of all state vocational education agency data collection forms. Each item of information on a data collection form was classified in relation to the most appropriate Project EDNEED question(s). Subsequent analyses revealed the extent to which the available data corresponded to the informational needs of user groups at the national, state and local levels.

In the second phase of Project EDNEED II, field visits were made to ten states to gather more information on alternative approaches to answering the top-priority Project EDNEED I questions. Preliminary analyses of the states' data collection forms had raised numerous questions concerning the accessibility of the data being collected.

The field visits provided information on the problems that would be encountered in collecting the necessary data and aggregating them to the appropriate levels.

The results of Project EDNEED II are presented in four volumes. In Volume I the informational needs identified in Project EDNEED I are discussed in relation to the data currently available at the state level as indicated by state agency data collection forms. The procedures used to derive and organize the vocational education Data Base are described, and an exemplary core of questions and data elements is presented which represents information that is both highly needed and widely collected. A procedure for empirically selecting alternative sets of questions is also described in detail.

The Data Base that was developed is presented in its entirety in Volume II. Each EDNEED question and corresponding data elements are indexed in terms of relative need and current availability. The index of need reflects the combined ratings of federal, state and local data user groups, with each level receiving equal importance weightings in the analyses.

The state agency data collection forms that were coded and analyzed during the course of the project are listed in Volume III. Each form is categorized by its major subject areas, and a cross-index is included to enable the reader to locate the various states' forms according to content. In addition to documenting all the forms that were included in the Project EDNEED II analyses, Volume III is intended to assist state agencies in locating data collection instruments that might facilitate their own development of forms.

Volume IV presents the results of the field visits to ten states and focuses on the procedures those states would use to answer the 50 highest priority EDNEED questions. Alternative approaches to answering each question are presented, and problems relating to data aggregation, format and data element definitions are discussed.

FOREWORD

This is the second of four volumes that together constitute the final report of Project EDNEED II.* In recognition of the importance of accurate and timely information to every aspect of the vocational education enterprise, this project has documented the extent to which today's information needs are being met in the states and territories. Through a detailed analysis of data items on state forms from all 50 states and five of the six U. S. territories, a comprehensive national profile has been obtained of unit information currently available from local sources. From this empirical data, Project EDNEED II derived quantitative indices of availability for each question and element in the first 11 (local) files of the EDNEED Classification Document (Drewes, Nerden and Porter, 1976). A systematic comparison was made between the information available and information already prioritized as needed in Project EDNEED I (Porter, 1976). The methods by which (a) available information was identified in the states and territories, (b) the comparison of needed and available data was accomplished, and (c) an essential national data "core" may be derived are discussed in detail in Volume I of the Project EDNEED II Final Report (Lawrence, 1976). The present volume contains the results of the match between needed and available information. These results are presented in the form of a Data Base of 209 questions and 1065 information elements, with accompanying indices that demonstrate for each information unit how "needed" and how "collected" it is.

*EDNEED II - An Assessment of Current Methods of Fulfilling Empirically Determined Educational Information Needs, USOE Project #498 AH 50165.

Although the methodology of analysis of state vocational education agency (SVEA) forms, the details of the need/collect match, and examples of how the Data Base may be used in decision-making can be found in Volume I of this final report, a brief outline of the derivation and construction of the Data Base follows.

Figure 1 illustrates the conceptual model for the derivation of the Data Base. The left-hand large circle represents information currently sought by state vocational education agencies on vocational information forms. The right-hand large circle represents the information classified by category (e.g., curriculum, students, staff) in the Project EDNEED I Classification Document (Drewes, Nerden and Porter, 1976). The central, smaller circle illustrates the information prioritized as needed by Project EDNEED I. Five subsets so obtained are:

- (a) information collected though not contained in the Classification Document;
- (b) information collected though not prioritized as needed in Project EDNEED I;

Figure 1. Conceptual Model for Derivation of the Data Base

- (c) information both collected and prioritized as needed;
- (d) information prioritized as needed though not currently collected; and
- (e) information contained in the Classification Document but neither prioritized as needed nor presently collected.

Distribution of information into these five subsets depends upon the definitions of the words "need" and "collect." The criteria for inclusion in the Data Base were as follows:

1. the question/element was checked as needed by one or more constituents in the rating of the Project EDNEED I Classification Document, i.e., had a need index greater than zero; and
2. the question had at least one element currently being collected that can be used to answer it, or the element was being collected currently on a form by one or more SVEAs, i.e., had a collect index greater than zero.

In short, the questions and elements in the following pages represent information, resulting from the Project EDNEED I matching process, that is both needed by at least one vocational education constituency and collected by at least one SVEA.

Figure 2 shows the distribution of the 215 questions across the five subsets. For reasons discussed in Volume I of the Project EDNEED II Final Report, only the first 11 files of the Classification Document were relevant to this study. Of the 215 questions in Files 1 through 11, all but six had collect indices greater than zero. In other words, information was being collected on a form in at least one SVEA that could be used to answer 209 of the 215 questions identified in Project EDNEED I as being needed by at least one agency. All 215 questions, however, had need indices greater than zero. By the criteria mentioned

Figure 2. Distribution of Questions into the Five Subsets

above, then, the 209 questions in subset (c) have non-zero need and collect indices and are, therefore, included in the Data Base.

Figure 3 illustrates the distribution of elements as a result of the Project EDNEED II match, by the same criteria. Of the 1434 elements in Files 1 through 11 with need indices greater than zero, 1065 had collect indices greater than zero.

Figure 3. Number of Elements in Element Subsets (b), (c) and (d)

The resultant Data Base can be viewed, therefore, as a catalog of vocational education information that is currently both needed and collected. The degree to which the information is either needed or collected is measurable by the size of the indices, all of which are included in the Data Base, and all of which vary between zero and one.

Utility of the Data Base

This Data Base is intended to reflect only information that is both needed and currently collected by at least one SVEA. Therefore, some data are not included that were identified as highly needed by Project EDNEED I but were not found to be collected by any SVEA on forms analyzed by Project EDNEED II. Two underlying assumptions upon which the selection of this Data Base rests are:

1. that a feasible and useful Data Base, in accordance with general cost/benefit criteria, is that which represents needed information which is being sought by one or more SVEAs at the present time; and
2. that this is one of many possible data compilations that can be generated from the EDNEED studies.

In view of previous recommendations for a nationally uniform vocational education data system, for example, the higher the collection index for a given information element, the more feasible might be its mandated inclusion in such a system. A detailed section on the utility of the Data Base is included in Volume I of this final report. Illustrations are provided of ways the data can be used to provide a nationwide profile of the match between needed and collected vocational education information; to test hypotheses; to compare units of information by the extent to which they are either needed or collected, or

both; and to identify essential information as the basis for MIS design at the national, state or local level.

Organization of the Data Base

Information in the Data Base is organized by question, with associated elements listed under each question. Questions, and elements within questions, are listed in order of magnitude of their need indices. The information is, therefore, prioritized by the extent to which it is needed. It is possible to read sequentially through the questions, and likewise through elements within questions, to determine how widely SVEAs currently collect important data. Because the questions are enumerated in order of priority, an index to each question by topical area (file) is provided at the front of this volume to facilitate location of need/collect information on particular questions.

A sample page from the Data Base consisting of a sample question (File 6, Question 5) and its associated elements is shown in Table 1. The tabular format used for the Data Base consists of the following: rank, file, question, question title, need indices, collection index, need index over all agency levels, and number of SVEAs collecting the element. These individual parameters are dealt with separately in detail below.

Rank. Questions in the Data Base are ranked 1 through 209 by the value of the average need index over all levels. In the example, the question, "How related is the current employment to the occupation trained for?" was ranked 10th out of 209 in importance by Project EDNEED I raters. These ranks will differ from the Project EDNEED I

Table 1. Sample Page of the Data Base

Questions and Elements--As Needed by Agencies and Collected by SVEAs (Ranked by Overall Need)						
Rank	File	Question	Need Indices			
10	6	5	How related is the current employment to the occupation trained for?			
						Collection Index
			Over All Levels	National Level	State Level	Local Level
						(Proportion of SVEAs Collecting One or More Elements)
			0.2792	0.2498	0.2927	0.2951
						0.4727
			Need Index Over All Agency Levels	Number of SVEAs Collecting Element		
			0.7378	22	Employed in Occupation Trained for	
			0.7338	22	Employed in Related Occupation	
			0.6700	21	Employed in Unrelated Occupation	
			.	7	Collected to Specifications Other than Taxonomy's	

ranks for questions because they are based on only 209 of the 323 questions contained in the Classification Document.

File. The file number refers to the particular file in the Classification Document in which the question can be found. Files 1 through 11 follow a hierarchical organization in order from the curriculum level (File 1) to the school district level (File 11) as follows:

File 1	Curriculum
Files 2-4	Curriculum Expenditures
Files 5-6	Student/Completer
File 7	Staff

File 8	Property
File 9	School
Files 10-11	LEA Characteristics

In some cases the same question appears in different files, but because of its file location, it concerns different information. For example, "How is the curriculum identified?" appears as Question 1 in Files 1 through 4, with identical elements. Each has different need and collect indices because in Files 2, 3 and 4 the question concerns the identification of curriculum in relation to expenditures by activities, assignments and objects, respectively. In the example given in Table 1, the question is from File 6, the completer/early leaver file, and concerns individual student follow-up data. Coding of form items into this file (and File 5) was strictly limited to information on a single student identified by name or some other unique identifier.

Question. The question number identifies the question within a file. In the case of the example, the question is #5 within File 6 in the Classification Document.

Question title. The text of the question is as it appears in the Classification Document. In this case, the text is, "How related is the current employment to the occupation trained for?"

Need indices. Four similarity indices (S) were computed for each question in Project EDNEED I and are termed "need" indices in this printout.

1. Over all levels--Referred to in Project EDNEED II as the overall need index or (S_1), this is the average of the other three need indices. The questions are ranked by this index,

which represents the average priority placed on this question across national, state and local constituencies. For the question in this example, $S_i = .28$.

2. National level--Referred to in short as (NS_i), this index represents the composite rating of the importance of this question to national constituencies in Project EDNEED I; in this example, $NS_i = .25$. To determine the ranking of all questions by individual national, state or local need indices, see Volume V of the Project EDNEED I Final Report (Drewes et al., 1976).
3. State level--Referred to as (SS_i), this index represents the composite rating of the importance of this question to state-level constituencies, and in this example, $SS_i = .29$.
4. Local level--Referred to as (LS_i), this index represents the composite rating of the importance of this question to local constituencies, which in this case is .30.

Collection index. Referred to in short as (P_i), this number indicates the proportion of the 55 SVEAs collecting at least one element that could be used to answer a question. In the example, 47.2 percent (or 26 SVEAs) of the 55 SVEAs surveyed collected information on one or more of the state forms that could be used in answer to this question. The remaining data presented under each question relate to the information elements providing potential answers to the question.

Need index over all agency levels. Separate need indices for elements were not generated for the national, state and local levels. One overall general need index across all levels (S_k) represents the

priority attached to each element in Project EDNEED I. This numerical index is listed beside each element, and the elements are prioritized within questions by this index. In the example, three taxonomy elements currently appear on one or more state forms, the most highly prioritized of which has a need index of .7378. The need index for elements, like the need index for questions, varies between zero and one. This permits comparison in importance between elements in different questions. It should be noted, however, that the element need indices were computed differently from question need indices. In the example in Table 1, the element indices are numerically much larger than the question indices, yet the question is very highly ranked in importance, i.e., 10th out of 209. The indices for questions and elements were computed according to different formulae and, hence, are not directly comparable with regard to degree of need. The element entitled "collected to specifications other than taxonomy's" is no more than an "other" category. It indicates that information was collected by at least one SVEA to answer this question, but the data item on the SVEA form could not be matched with any existing element in the Classification Document. The decimal point under the need index indicates that no raters in Project EDNEED I were able to check the element as needed (since it was not in the Classification Document). In the example in Table 1, seven SVEAs currently collect "other" information with which to answer the question. Because no ratings of need are available for these data, and the element cannot be specifically identified, the "other" categories in the Data Base serve only a limited

function. They provide some estimate of the extent of data not listed in the Classification Document which are available to answer a question. Beyond that, they have little relevance to this study.

Number of SVEAs collecting the element. The collection index for elements can be expressed as either a proportion (in short, kP_i) or an absolute number of SVEAs. In the Data Base printout, to avoid confusion with the question collection index, the element collection index is the absolute number of SVEAs on whose forms this element currently appears, rather than the proportion of SVEAs collecting this element. In the example in Table 1, the first two elements are each collected by 22 SVEAs, and the third by 21 SVEAs. Seven SVEAs are currently collecting "other" information to answer this question. The correspondence between the ranking by element need and collect indices in this example is not to be construed as representative of all elements. The elements associated with most questions do not conform so neatly by collect index, although they are, as indicated above, ranked within questions by element need index (S_k).
